83rd Harden Conference: Autophagy – from Molecules to Disease II

3 - 7 June 2018
Chesford Grange, Warwickshire, UK

Autophagy continues to be one of the most exciting and topical subjects in biology. This joint meeting brings together experts in the autophagy field from across the world to present cutting edge research on the molecular control of autophagy and the roles of autophagy in immunity, physiology and disease.

Recent years have seen an impressive diversification in autophagy techniques and model systems, as well as seeing autophagy knowledge put to many novel practical applications, including disease intervention for which novel autophagy modulators are in the pipeline.

Topics include:

- Molecular regulation of autophagy
- selective autophagy
- Biochemical control of autophagosome assembly
